JUMO CTI-500

Inductive Conductivity/Concentration and Temperature Transmitter with switch contacts

Type 202755

Brief description

The device is used for the measurement/control of conductivity or concentration in liquid media. It is particularly suitable for application in media where severe deposits of dirt, oil, grease or gypsum/lime precipitates are to be expected. The integrated temperature measurement enables fast and accurate temperature compensation, which is of special importance when measuring conductivity. Additional functions permit the combined changeover of measuring range and temperature coefficient.

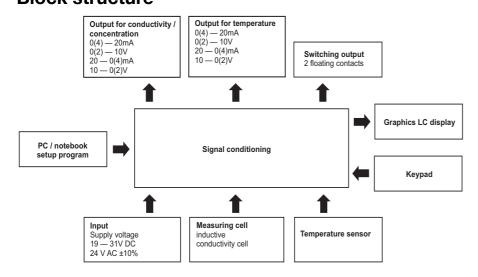

Two built-in switching outputs can be freely programmed to monitor conductivity/concentration and/or temperature limits. It is also possible to assign alarm and control functions (dilution).

The device is operated either from the membrane keypad and plain-text graphics display (operator language can be changed over) or through the user-friendly PC setup program. The display can be read off by simply rotating the housing cover. This applies to the installation both in horizontally and vertically arranged pipes. By using the setup program, the device configuration data can be saved for plant documentation and printed out. To prevent any tampering, the device can also be supplied without keypad or display. In this case, the setup program is needed for programming.

The JUMO CTI-500 is available either as a combined unit (transmitter and measuring cell together in one unit) or as a split version (transmitter and cell connected by cable). The split version is particularly suitable for plant subjected to strong vibration and/or significant heat radiation at the measurement point, or for installation on sites that are difficult to access. Immersion models up to 2000 mm are available for application in open containers or sluices.

Typical areas of application: Freshwater and wastewater engineering, air conditioning systems and cooling tower monitoring (dilution control), rinsing baths (e.g. monitoring electroplating baths), inlet and final checks in factory water treatment plant, concentration monitoring, vehicle wash plant, etc.

Block structure

Key features

- · Activation of up to four ranges
- Activation of up to four temperature coefficients
- · Concentration measurement of
 - caustic soda NaOH
 - nitric acid HNO₃
 - a freely definable curve (through the setup program)
- Fast-response temperature sensor
- Temperature compensation
 - linear
 - natural water
 - individual characteristic (learning function)
- Operation
 - via keypad and LC display
 - through setup program
- Operator languages: English, French, German, Italian, Dutch, Spanish, Polish, Portuguese, Russian, Swedish
- By using the setup program:
 - user-friendly programming
 - plant documentation
- Learning function for the temperature coefficient
- Individual characteristic for concentration indication
- Dilution control

Data Sheet 202755

Page 2/17

Functional description

The inductive measurement method permits largely maintenance-free acquisition of the specific conductivity, even in the toughest media conditions. As opposed to the conductive measurement method, problems such as electrode decomposition and polarization do not occur.

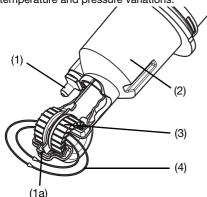

The conductivity is measured using an inductive probe. A sinusoidal a.c. voltage feeds the transmitting coil. Depending on the conductivity of the liquid to be measured, a current is induced in the receiver coil. The current is proportional to the conductivity of the medium.

Device description

Measuring cell

The measuring cell consists of a hermetically sealed polypropylene (PP) or polyvinylidenefluoride (PVDF) body inside which the two measurement coils are arranged. A bore in the measuring cell enables the medium to flow through. The measurement principle entails an inevitable electrical isolation between the sample medium and the signal output.

The measuring cell is largely unaffected by temperature and pressure variations.

- (1) Temperature sensor, exposed
- (1a) optionally: internal
- (2) Cell body in PP
- (3) Measurement coils
- (4) Liquid loop

Exposed temperature sensor

The sensor (in a stainless steel sleeve) exhibits a very fast response to temperature variations. This is especially important for CIP processes (phase separation).

Internal temperature sensor

The sensor is integrated in the PP body. This construction ensures that no metal parts come into contact with the sample medium (important with corrosive media). However, temperature acquisition is somewhat slower here.

Temperature compensation

Since conductivity largely depends on the temperature of the medium, it is usually necessary to compensate for the temperature effect.

The device allows both linear and non-linear temperature compensation.

If required, temperature compensation can be switched off, for example, when the temperature conditions on the measurement site are stable or when temperature compensation is carried out in the software, in external evaluation devices (PLC or similar).

Process connections

To cover a wide variety of applications, the device can be supplied with different process connections (also as an immersion model), see dimensions.

Installation at the measurement point

The operating position is generally unrestricted. However, it is essential to ensure that there is a continuous exchange of the sample liquid in the flow channel.

Transmitter

The CTI-500 transmitter has been designed for use on site. A rugged housing protects the electronics and the electrical connections from corrosive environmental conditions (IP67).

A vent screw with a PTFE membrane prevents condensation.

Operation

The JUMO CTI-500 can be operated either from the device keys and the graphics LC display and/or through the setup program from a PC or laptop.

The device can be secured against unauthorized alteration by a password.

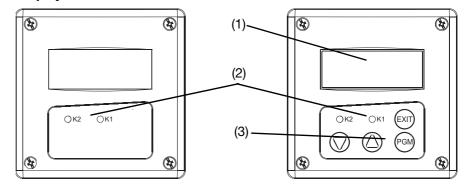

Functions of the outputs

Analog outputs

- One analog signal output for conductivity/ concentration and temperature respectively.
- The analog output signals are freely scalable (range start and end values).
- The response of the analog outputs to over/underrange or alarm can be programmed.
- Simulation of the signal output:
 The analog signal outputs can be freely set in the manual mode.

Application: "Dry-run" start-up of the plant, trouble-shooting, servicing.

Displays and controls

Version without a display Operation/configuration through the setup program only Version with a display Operation/configuration from the keys or through the setup program

- (1) Graphics LC display
- (2) LEDs for the switching status indication of the outputs K1 and K2
- (3) Keys

- (7) Temperature of medium
- (8) Conductivity measurement
- (9) Unit of conductivity measurement

Switching outputs

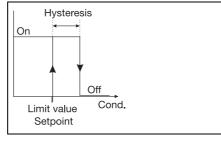

The device features two floating switching outputs (solid-state relays) as standard.

These can be used freely for monitoring the conductivity/concentration or the temperature.

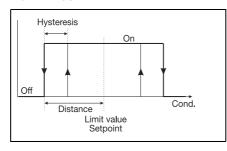

The following functions can be assigned:

- ☐ Limit monitoring (MAX. or MIN. limit comparator) with programmable hvsteresis
- Pulse function (the output switches briefly on reaching the switching point, then opens again).
- ☐ Pull-in and drop-out delay
- □ Inverted switching outputs
- ☐ Response to overrange/underrange or with activated measuring circuit monitoring (pull-in/drop-out).
- ☐ "Calibration timer run down" signal.

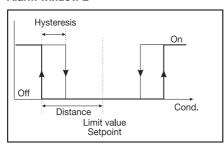

MIN limit comparator

Alarm window 2

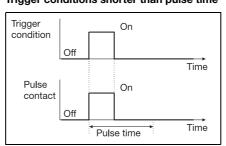

Pulse contact

Trigger conditions longer than pulse time

Pulse contact

Trigger conditions shorter than pulse time

Binary inputs

The two binary inputs serve to implement the following functions:

- Key inhibit
- **HOLD** mode
- 4-fold range changeover
- 4-fold temperature coefficient changeover
- Initiation of dilution function and biocide dosing

Special functions

- The learning function for the temperature coefficient enables exact measurement of media with a non-linear characteristic. During a temperature change, the device "learns" the temperature coefficient of the present medium and stores the profile. The stored values then enable the correct indication of the temperaturecompensated conductivity.
- Individual characteristic for concentration indication.

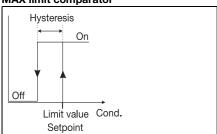

An individual characteristic with 20 interpolation points can be entered through the setup program. This function can be used to generate special characteristics for specific media (e.g. special detergents). This results in correct measurements that contribute to assuring the quality and saving costs.

Dilution control Various processes that find their application in wet cooling towers are stored as sequence control (biocide dosing and subsequent inhibiting of dilution). Additional information can be found in the operating manual.

Calibration timer The calibration timer draws your attention to a calibration schedule. This function is activated by entering a number of days, after which recalibration has to be carried out (plant or operator requirement).

Order code		-		-		-		/		, ^a
Order example	202755/65	-	108	-	1000	-	21	/	000	

^a List extra codes in sequence, separated by commas.

The PC setup program is required for programming the device, see accessories.

A calibration kit is absolutely essential for commissioning. If required, please include in your order (accessories).

Mounting items (union/ring nuts, mounting brackets) do not come with delivery. If required, please include in your order (accessories).

d Special tee is not included in delivery.
Maximum temperature of medium: 60 °C.
If required, order 1 set M12 plug / socket connectors, see accessories.
Only with process connections 168 and 169, in combination with extra
